

EDX - Warehouse Management System

Automation of the entire logistics business process

How quick the warehouse starts processing orders depends on the communication with the ERP system. Electronic data exchange (EDI) with your logistic partners saves time and effort on manual data entry and significantly reduces processing times.

The Logistics Extension for EDX

EDX - Warehouse Management System is an interface app for connecting logistic partners to your Microsoft Dynamics 365 Business Central ERP system. This includes the automated, bidirectional exchange (EDI) of goods receipt and goods dispatch messages with external logistics companies as well as the processing of inventory data from the logistics provider.

Message Types Out of the Box

When the app is installed, the following additional message types are available:

- Stock from the logistics company
- Incoming/outgoing goods receipt
- Incoming/outgoing goods dispatch
- Goods dispatch status from the logistics company

Your Benefits at a Glance

- No manual entry of articles, serial and batch numbers, or package data
- Cost reduction and resource optimisation for goods receipt recording, goods dispatch recording and inventory
- Higher work speeds and error prevention through automated data exchange

Automation features

The level of automation can be selected. If, for example, the logistics provider sends a notification about the delivery of the goods, the automatic creation of the delivery note and the invoicing can be triggered.
